

ABSTRACT

A concrete form removal tool is provided. The tool is used for efficient removal of a concrete form from a concrete structure that has sufficiently cured with out the tool contacting the structure. The tool includes an elongated handle, and a form engagement member affixed to and extending transversely from the handle. The form engagement member has a hooked end that is adapted to engage the form in a manner such that the handle is initially positioned parallel to the concrete structure from which the form is to be removed from, and such that the when the handle is pulled upon in a direction away from the structure the form is removed therefrom.
